Météorologie

Le cumul de pluie entre septembre et mai est de **1421 mm sur le Hautes Terres** (station de Kobana à Andranomenalatra) et de **1309 mm au Moyen Ouest** (poste situé à la maison du gardien des sites expérimentaux agronomiques à Ivory). Après la fin du semis en décembre, un arrêt des pluies pendant approximativement 20 jours a été noté.

Sur les Hautes Terres

Dans le Moyen Ouest

Grille d'utilisation des variétés d'altitude

En l'état actuel de notre expérience du comportement des variétés d'altitude, il est possible de proposer la grille d'utilisation suivante en fonction de l'altitude et du niveau de fertilisation de la culture (ou du niveau de fertilité du sol). FOFIFA 173, à cycle long, doit être réservée aux zones d'altitudes intermédiaires 1300-1500 m. Entre 1500 et 1650 m, son utilisation est possible à condition de pouvoir semer en octobre.

| | | altitude | | |
|--|--------|---|---|---|
| | | en dessous de 1500 m | 1500 à 1650 m | 1650 à 1800 m |
| niveau d'utilisation des intrants ou niveau de fertilité du sol ou | Elevé | FOFIFA 173 FOFIFA 180 FOFIFA 172 FOFIFA 171 Chhomrong Dhan FOFIFA 181 (grains blancs) FOFIFA 161 (grains blancs) FOFIFA 186 | FOFIFA 180 FOFIFA 173 (à semer en octobre) FOFIFA 172 Chhomrong Dhan FOFIFA 171 FOFIFA 181 (grains blancs) FOFIFA 161 (grains blancs) FOFIFA 186 | FOFIFA 180 Chhomrong Dhan FOFIFA 181 (grains blancs) |
| | Moyen | FOFIFA 173 FOFIFA 180 Chhomrong Dhan FOFIFA 172 FOFIFA 171 FOFIFA 181 (grains blancs) FOFIFA 161 (grains blancs) FOFIFA 186 | FOFIFA 180 Chhomrong Dhan FOFIFA 173 (à semer en octobre) FOFIFA 172 FOFIFA 171 FOFIFA 181 (grains blancs) FOFIFA 161 (grains blancs) FOFIFA 186 | FOFIFA 180 Chhomrong Dhan FOFIFA 181 (grains blancs) |
| | Faible | FOFIFA 173 Chhomrong Dhan FOFIFA 186 | Chhomrong Dhan FOFIFA 173 (à semer en octobre) FOFIFA 186 | FOFIFA 180 Chhomrong Dhan |

Perspectives

Les variétés suivantes issues des tests variétaux (EV) à la station pourraient être évaluées en essais paysans

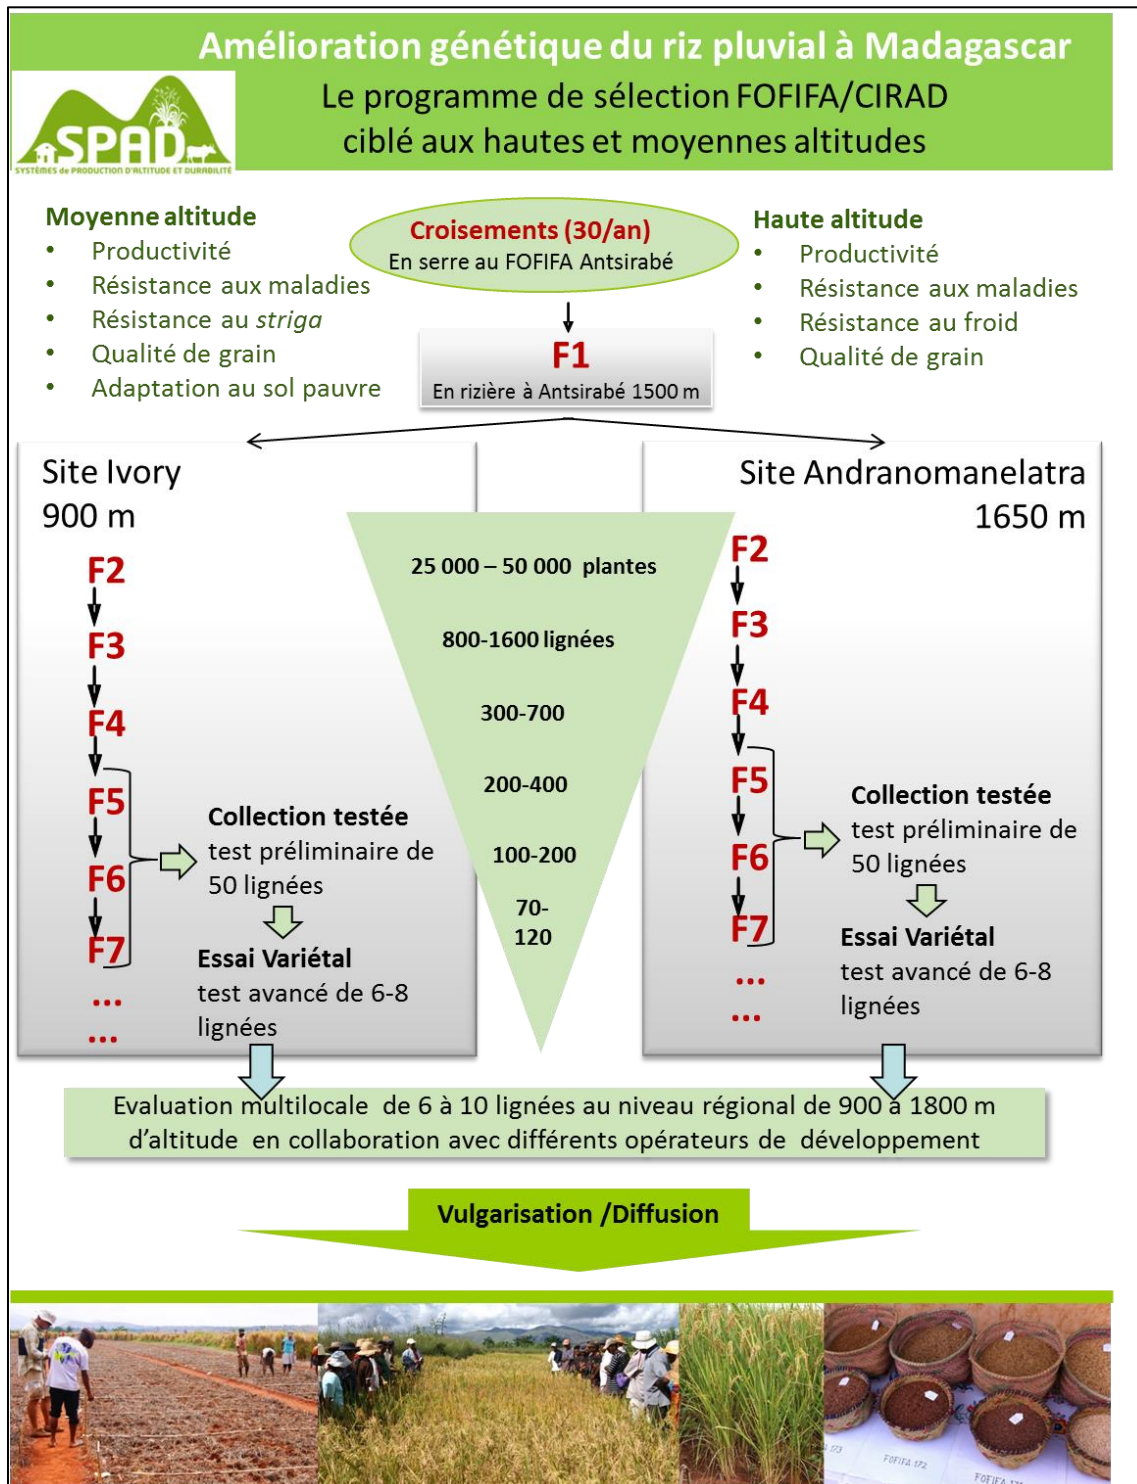

Talata : les lignées Sd 019-1-1-1-1-2-3-5-4-1 et Sd 185-42-5-1-5-5 et Sd 234-30-2-1-2-4, basées sur leur bon rendement en FU et FM

Ivory : les lignées SCRiD 091 10-1-3-2-5-3-2, SCRiD 091 38-3-1-3-1-3-4, SCRiD 091 38-4-3-4-1-1-5-4 et SCRiD 090 72-3-1-3-5-1-4-4, basées sur leur performance dans les deux situations de fertilité (FU et FM).

Les lignées WAB706-3-4-K4-KB-1, WAB56-50 pour leur préférences et le rendement dans les essais paysans gérés par le GSDM et la lignée SCRiD 090 72-3-1-3-5-1- pour son bon comportement dans les essais de reseau des fermes references. Une inscription dans le catalogue pourrait être envisagée.

Andranomanelatra : les resultats des tests ne permettent pas de proposer des variétés pour cette année.

Schéma de programme de sélection SCRiD

Création de populations F2 par croisement manuel

32 croisements ont été réalisés manuellement dans la serre du FOFIFA à Antsirabe : 17 destinés spécifiquement aux Hautes Terres, 15 destinés spécifiquement au Moyen Ouest :

Pépinière F1

Quantité de semences F2 disponible pour la campagne 2016/17. Au total 7 à 1300g de semences de treize croisements ont été produite en pepinière F1. Des croisements avec des quantités de semences au-dessous de 200g ont été repiqués pour une culture pendant la contre-saison au bas-fond à Ivory (Moyen Ouest).

Sélection Généalogique

Des pépinières F3 à F10 sont conduites pour une sélection généalogique à la station d'Andranomanelatra

Sélection dans les lignées F3 Hautes Terres

Au total 158 lignées (5 plantes par lignée) et 103 plantes ont été sélectionnées parmi les 1017 F3 en évaluation. Ce qui représentera 891 lignées en sélection au stade F4 l'année prochaine.

Sélection dans les lignées F4 Hautes Terres

30 lignées (5 plantes dans la lignée F4) et 32 plantes individuelles ont été sélectionnées parmi les 377 lignées F4 en évaluation, ce qui représentera 182 lignées en sélection au stade F5 l'année prochaine.

Sélection dans les lignées F5 Hautes Terres

62 lignées (5 plantes dans la lignée F5) et 2 plantes individuelles ont été sélectionnées parmi les 528 lignées F5 en évaluation ce qui représentera 312 lignées en sélection au stade F6 l'année prochaine. A partir de la génération F5, les masses-ligne et les masses-famille sont récoltées pour les lignées sélectionnées. Une première évaluation en collection testée pourra donc être réalisée pour certaines des lignées sélectionnées. Des rendements extrapolés à partir des poids des masses récoltées sont donnés à titre indicatif. Ces rendements sont à comparer aux rendements des lignes du témoin Chhomrong Dhan régulièrement positionné sur les bandes de sélection.

Evaluation de la résistance à la pyriculariose des lignées avancées

Toutes les lignées présentes dans les essais en collections testées à Andranomanelatra (1650m), à Talata (1500m) et à Ivory (900m) sont évaluées pour la résistance à la pyriculariose dans ce dispositif: une seule répétition de 2 lignes pour chaque lignée évaluée.

Evaluation Variétale Hautes Terres

Collections testées Hautes Terres

Une collection testée est conduite sur deux sites en labour à Kobana et Andranomanelatra (1650m). A Kobana en conditions FU avec apport de 5T/ha de fumier seul (FU). A Andranomanelatra en conditions FM avec apport de 5T/ha de fumier, 500 kg/ha de dolomie, 150 kg/ha de NPK et 80 kg/ha d'urée. Chaque variété est observée sur des parcelles élémentaires de 5.32 m² sur deux (FM) et quatre (FU) répétitions. Les notes qualitatives vont de 1 à 9 (1 très bon à 9 très mauvais). Semis effectué le 28/10/2014. Les abréviations des caractères sont expliqués en annexe.

Appréciation de la qualité de grain, usinage et de préparation de riz

Objectif : tester la méthode d'évaluation ; apprécier les critères organoleptiques et de l'usinage des nouvelles variétés de riz par différents utilisateurs

Site : Andranomanelatra

Animateurs : Sambatra (technicien FOFIFA), Tatiana (doctorant FOFIFA/CIRAD), Ravo (stagiaire FOFIFA), Kirsten (chercheur CIRAD/FOFIFA) ; Estelle (stagiaire FOFIFA), Herizo (Ingénieur FOFIFA)

Participants : 39 producteurs et main d'œuvres FOFIFA

Matériel végétal :

Sept variétés adaptées à l'écologie des Hautes Terres, dont trois variétés améliorées inscrites récemment dans le catalogue variétal national, trois lignées avancées avec un type de grain spécifique et un témoin local (variété la plus cultivée)

| Nom variété | | caracteristiques | SOURCE GRAINS |
|---|-----------------------------|----------------------------------|-------------------|
| Fofifa 180 | Nouvelle variétés inscrite, | grain rond et rouge | CT/Catalogue |
| Fofifa181 | Nouvelle variétés inscrite, | grain rond et blanc | CT/Catalogue |
| Fofifa 186 | Nouvelle variétés inscrite, | Grain rond et rouge | CT/Catalogue |
| scrid194 3-1-1-4-3-1-1 | Lignée avancée à | grain longue et fin, grain blanc | CT/multiplication |
| Scrid 220 5-3-1-1-2-4 Chhomrong DhanxNerica3 | Lignée avancée à | grain longue, grain blanc | CT |
| Scrid 225 93-2-1-2-2-3 Fofifa 161xChomrong Dhan | Lignée avancée à | grain gros et rond | CT |
| Chhomrong Dhan | Témoin local, | grain demi-rond, rouge | CT/Catalogue |

Resultats

Liste des critères de préférence des nouvelles variétés de riz :

- ✓ Forme (paoziny)
- ✓ Couleur (lokony)
- ✓ Gout (tsirony)
- ✓ Facilité de décorticage (fahamorany rehefa totoina)
- ✓ Digestibilité (mateza an-kibo)
- ✓ Volume après cuisson (fahabetsahany masaka)
- ✓ Quantité dans le kapoka (fahabetsahany anaty kapoka) = lié à la forme de grain
- ✓ Brisure (fipasahany)
- ✓ Facilité lors de la cuisson (fahamorany andrahoana) = cuisson plus courte sans ajouter l'eau
- ✓ Nutritive/vitamines

Après discussion, les critères de **couleur de grain la forme de grain et la facilité de décortilage** étaient vu comme plus important pour apprécier une nouvelle variété. Le **goût**, également d'importance a été évalué après cuisson. L'évaluation sur forme de notation s'est déroulée de manière individuelle, chaque participant a noté les grains disposés en paddy, décortiqués et blanchis et nettoyés de sept lignées de riz pluvial à la station du FOFIFA à Andranomanelatra.

Essais variétal (Matrix)

Le dispositif est un split plot avec 4 répétitions. Les grandes parcelles permettent de comparer l'apport de fumure minérale (500 kilos de dolomie+150 kilos NPK+ 50 kilos Urée) + fumier (FM) à l'apport de fumier seul (Fu). Le fumier est apporté à la dose de 5 tonnes/ha. Les petites parcelles permettent de comparer les variétés entre elles pour un niveau de fumure donné. Au total, on a donc 8 parcelles élémentaires de 20 m2 par variété dont 4 en labour/FM et 4 en labour/Fu.

Pour le rendement l'analyse a montré de forts effets significatifs pour l'effet bloc, mais pas d'effet significatif pour le facteur variété, fertilisation ou leur interaction.

Dans les deux niveaux de fertilisation, le témoin Chhomrong Dhan est le plus performant, suivi par SCRiD 186 65-4-1-4-3-4-4 en FM et par SCRiD 198 62-2-3-2-1-1-3 en FU. Par contre l'effet n'est pas significatif.

Collection testée Talata

Au total 30 nouvelles lignées à la fin de sélection et eux témoins (Fofifa 173 et Chhomrong Dhan ont été conduites en collection testée à Talata en condition FM et FU. Avec Alternance sur le terrain de 2 témoins Chhomrong Dhan et Fofifa 172. Les notes qualitatives vont de 1 à 9 (1 très bon à 9 très mauvais).

- FU : 2 répétitions de 4.2 m², en labour. 5 tonnes de fumier et 500 kg/ha Dolomie sont apportées au poquet au moment du semis
- FM : 2 répétitions de 4.2 m², en labour. Avec 5 tonnes de fumier, et 300 kg de NPK 11:22:16/ha et 500 kg/ha Dolomie sont apportés au poquet au moment du semis. 80 kg/ha d'urée sont apportés en deux apports en cours de cycle.

Essai Variétal Talata

Neuf lignées ont été conduites sous condition FM (5t/ha + fumier 300 kg NPK/ha +50 kg Urée/ha) et FU (5 t/ha fumier) à Talata en trois et cinq répétitions, respectivement. Quatre lignées ont un rendement égal ou supérieur à la moyenne dans le deux conditions (Figure).

Sélection généalogique Moyen Ouest

Des pépinières F3 à F10 sont conduites pour une sélection généalogique sur le terrain expérimental à Ivory (900m).

Sélection dans les lignées F3 Moyen Ouest

Au total 115 lignées (5 plantes par lignée) et 34 plantes ont été sélectionnées parmi les 1017 F3 en évaluation ce qui représentera 609 lignées en sélection au stade F4 l'année prochaine.

Sélection dans la collection complémentaire

Afin de récupérer des lignées intéressantes pour le programme de moyen Ouest, une sélection a été effectuée dans la collection complémentaire. A part de ces lignées cette collection ne sera plus conduite. Au total 25 plantes ont été sélectionnées dans cinq lignées d'intérêt agronomique élevé.

[illegible]

Développement des populations

Résumé populations MS

Trois populations male stérile sont en brassage à la station d'Ivory dans le moyen Ouest, dont deux populations adaptées à l'écologie du Moyen Ouest et une ciblée pour les Hautes Terres. La dernière sera transférée à Andranomenalatra pour la campagne 2016-2017. Un effectif entre 700 et 1000 plantes mâles stériles ont été sélectionnées dans chaque population conduite à Ivory pendant la campagne 2015/16. Des grains de chaque plante male stérile (ms) constituent un sachet. Le nombre des grains/sachet est documenté pour chaque population.

Evaluations essais variétaux Moyen Ouest

Collection testée

Une collection testée est conduite sur trois niveaux de gestion, dont FU, FM et SCV : avec alternance sur le terrain de 2 témoins Nerica 4 et B22. Au total 50 variétés sont testées. Les notes qualitatives vont de 1 à 9 (1 très bon à 9 très mauvais).

- FU : 2 répétitions de 6.84 m2, en labour. 5 tonnes de fumier seul sont apportées au poquet au moment du semis
- FM : 2 répétitions (une de 6.72 m2 et une de 7.36 m2) en labour. 5 tonnes de fumier, et 300 kg de NPK 11:22:16/ha sont apportés au poquet au moment du semis. 80 kg/ha d'urée sont apportés en deux apports en cours de cycle.
- SCV : 2 répétitions (une de 7.68 m2 et une de 7.92 m2) en SCV sur un précédent de mucuna pur SCV. 150 kilos de NPK 11:22:16/ha sont apportés au poquet au moment du semis. 80 kg/ha d'urée sont apportés en deux apports en cours de cycle.

Evaluation participative d'essai « Collection testée FU » Ivory, 18 Mars 2016

Objectif : Apprécier ensemble avec des producteurs et productrices les nouvelles lignées de riz pluvial.

- (1) Connaître les caractères variétaux important pour les producteurs/ice
- (2) Evaluer les nouvelles lignées par rapport aux caractères identifiés
- (3) Contribuer au choix des lignées à proposer pour les essais multilocaux

Participants : 35 producteurs, dont 20 femmes d'Ivory et trois villages voisins et trois techniciens agricoles

Matériel : 50 lignées de riz pluvial (génération F6++) et deux témoins (Nerica 4 et B22), conduites sans apport d'engrais minéral avec 5t/ha fumier.

Méthode : discussion semi-ouvertes en grand groupe pour identifier des critères et caractères variétaux important pour les producteurs, suivi par une appréciation (sous forme de notation : 1 mauvais à 4 très favorable) des 52 lignées pour les trois à quatre critères les plus importants en petits groupes.

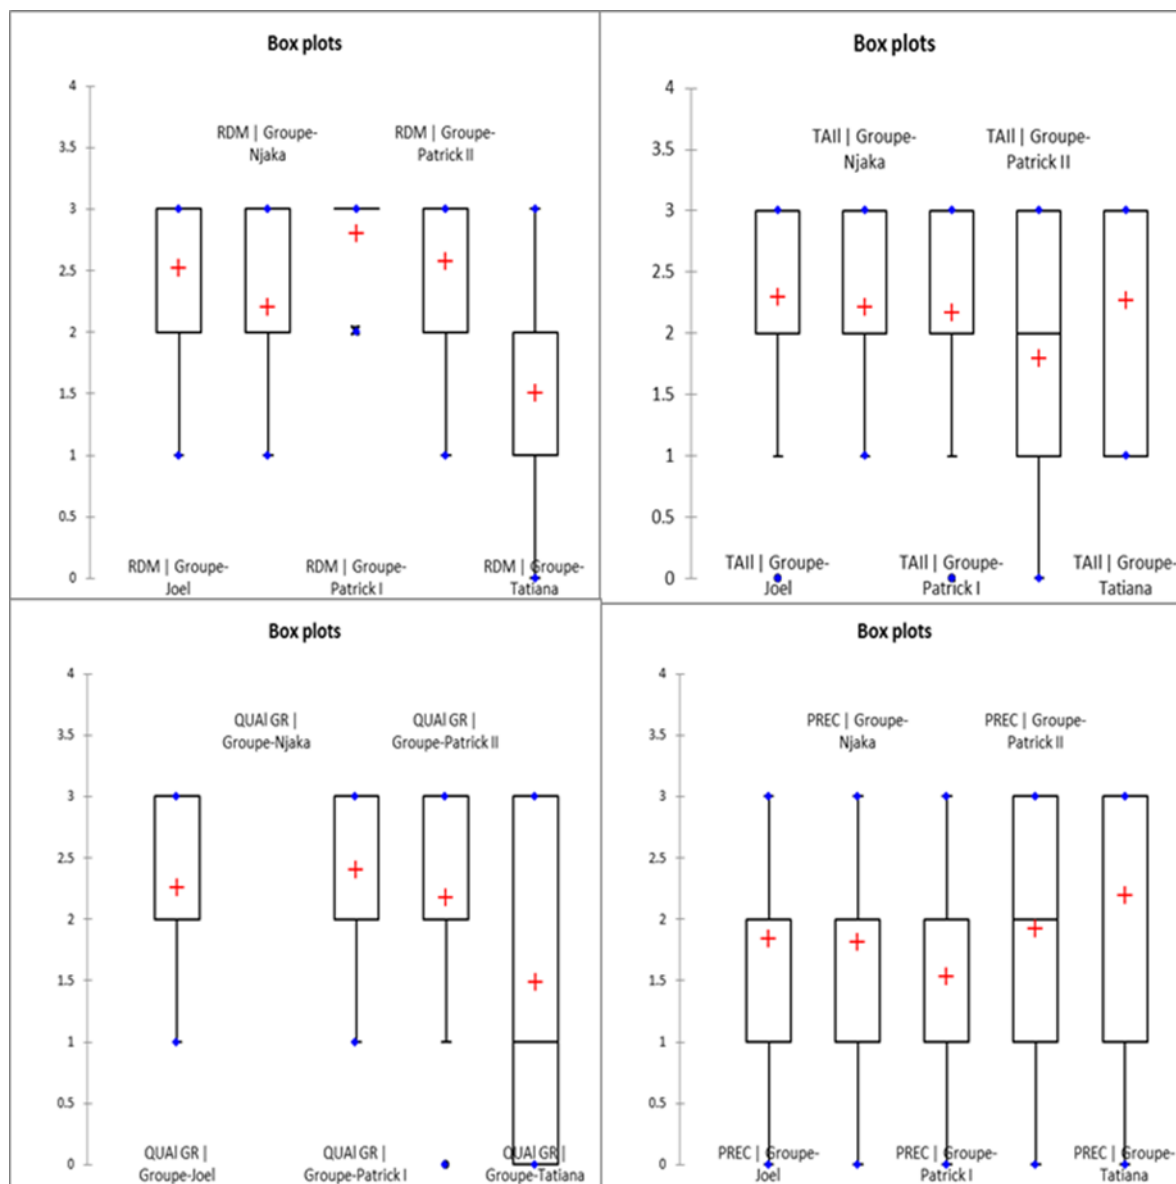

Résultats

Liste des critères d'importance pour les producteurs:

| Critère | appréciation | Critère les plus important (votes) |
|----------------------------------|--|------------------------------------|
| Résistance au striga | Il faut des variétés qui échappent au striga | Xxx |
| Productivité | Elevé | xxx |
| Rendement usinage | Elevé | |
| Nombre des grain sur le panicule | Panicule bien fourni en grain | |
| Cycle | Un peu plus précoce que Nerica 4 | xxx |
| Qualité grain | | xxx |
| - Forme de grain | Petit ronde, contraire du maïs, comme Nerica 4 | |
| - Couleur du grain | Un peu jaune comme Nerica 4 | |
| Hauteur du plant | Entre 80 et 90 cm | xxx |
| Facilité au battage | Nerica 4 un peu difficile à battre | |
| Arome | Des variétés aromatiques, comme Nerica 1 pas bien apprécié par tous les participants (sauf un) | |

Quatre groupes, dont un groupe des techniciens (groupe Tatiana) animés par un facilitateur/trice ont noté chaque parcelle (lignée) pour les quatre critères les plus importants : productivité (RDM), cycle (PREC), qualité de grain (QUAL), hauteur du plant (TAIL). Les box plots montrent que les différents groupes de

producteurs apprécient les variétés relativement similaires, à l'exception du groupe des techniciens pour les critères rendement et qualité de grain.

Pour différencier des lignées et pour mieux comparer les nouvelles lignées au témoin Nerica 4, la variété la plus cultivée et préférée dans la région, un index de préférence était calculé, une fois en accordant un poids plus élevé aux notes d'appréciation de la qualité de grain et une fois en mettant plus de poids sur les notes d'appréciation de la précocité et de rendement (index_FL_RDM). Selon les deux Index, six lignées étaient plus appréciées que Nerica 4 par les producteurs

Formule Index:

$$\text{Index_Qual} = 3 * \text{note RDM} + 3 * \text{note PREC} + 2 * \text{note Tail} + 4 * \text{note QUAL}$$

$$\text{Indes_FL_RDM} = 4 * \text{note RDM} + 4 * \text{note PREC} + 2 * \text{note Tail} + 3 * \text{note QUAL}$$

Analyse combiné des essais collection testée

Pour le rendement il y a des différences significatives entre les trois sites (conditions de gestion de la culture), entre les variétés et l'interaction entre les deux effets. Les corrélations entre les trois sites pour la variable Rendement indiquent que surtout les conditions FU s'opposent aux conditions FM et SCV et que les performances des variétés en SCV et FM sont corrélées.

Anova

Meilleur lignées en conditions FU et FM

Les variétés SCRID 091 10-1-3-2-5-3-2, SCRID 091 38-3-1-3-1-3-4, SCRID 091 38-4-3-4-1-1-5-4 et SCRID 090 72-3-1-3-5-1-4-4 sont les plus performantes dans les deux situations de fertilité (FU et FM).

Essais en Milieux Paysan

TEST DE 6 VARIETES avec producteurs GSDM au Moyen Ouest

Une série des six essais variétaux avec cinq nouvelles lignées de riz pluvial et un témoin (Nerica 4) a été conduite avec le technicien M José du GSDM. Les six essais ont été conduits dans six villages au Moyen Ouest entre 900 et 1200 m d'altitude. La mise en place, le suivi, la collecte des données et l'évaluation participative a été assuré par M. José.

Objectifs:

- 1) Tester des nouvelles variétés de riz pluvial en conditions réelles chez l'agriculteur.
- 2) Appréciation et sélection participative des variétés de riz pluvial pour une diffusion possible

1. Liste des Variétés :

| N° Variété | Nom variété |
|------------|------------------------|
| V1 | Nerica 4 témoin de |
| V2 | Fofifa 182 |
| V3 | SCRID 195 A1-3-3-4-2-4 |
| V4 | WAB 706-3-4-K4-KB-1 |
| V5 | WAB 56-50 |
| V6 | Fofifa 185 |

Le dispositif de terrain était le même pour chaque producteur. Il s'agit d'un CRBD, composé de 2 répétitions et six variétés, dont un témoin (Nerica 4). Le semis a été effectué avec des écartements de 20 cm entre les lignes et 20 cm dans les lignes.

Résultats

En raison des superficies variables et documentées d'une manière insuffisante pour une analyse comparative, les rendements mesurés ont été transformés en pourcentage par rapport au témoin Nerica 4 pour chaque essai. L'analyse ci-après montre les résultats de ces pourcentages (ANOVA, moyennes)

Préférence variétales des producteurs.

Les essais ont été évalués par 3 à 11 producteurs par site. Ils ont choisi les trois variétés les plus appréciées par test et indiqué quelles variétés ils préfèrent plus que Nerica 4.

| producteur | Préférence variétales | | | | | | Nr VAR préféré > N4 | Nbr évaluateurs |
|------------|-----------------------|--|---------------|---|---------------|---------------------------------------|---------------------|-----------------|
| | Num VAR | | VAR | | VAR | | | |
| P1 | S195 | Productive, longue tige, longue panicule | WAB56 | Productive, courte tige, beaucoup de tallage | F185 | Productive, longue tige, cycle court | nr | 6 |
| P2 | S195 | Longue tiges et productive | WAB56 | Productive, résiste au vent puisque tiges courtes | F185 | Longue tiges et productive | nr | 3 |
| P3 | F182 | un peu plus légée que V5, | WAB56 | bcp rdm, | WAB706 | rapide, | F182, WAB56 | 5 |
| P4 | N4 | Productive, beaucoup de tallage, résiste au striga | WAB706 | Productive, beaucoup de tallage, longue tige | WAB56 | Productive et battage facile | WAB706, WAB56, F185 | 6 |
| P5 | F182 | Bonne grain avec du poids | F185 | Avec du poids et battage facile | WAB706 | Productive et battage facile | F182, WAB706, F185 | 5 |
| P6 | F182 | Bonne avec du poids, productive pas de grains stériles | WAB706 | Bonne grain et précosse | F185 | Bonne grain, mais avec du poids moyen | F182, WAB706, F185 | 11 |

Résumé préférence variétal et performance (gain de rendement par rapport au témoin (Nérica 4))

| Num | Nom Variété | Nombre de choix producteur | Sites avec >5% gain de rendement sur Nerica 4 |
|-----|------------------------|----------------------------|---|
| 1 | Nerica 4 témoin | 1 | |
| 2 | Fofifa 182 | 3 | 3 |
| 3 | SCRID 195 A1-3-3-4-2-4 | 2 | 1 |
| 4 | WAB706-3-4-K4-KB-1 | 4 | 2 |
| 5 | WAB56-50 | 4 | 3 |
| 6 | Fofifa 185 | 4 | 3 |

Au total quatre groupes de producteurs évaluateurs ont choisi **les deux variétés WAB et la Fofifa 185. Fofifa 182 a été choisi par trois groupes et la nouvelle variété SCRID 195 A1 par deux groupes.** Le témoin Nerica 4 a fait l'objet de choix seulement par un groupe de village de Tsaratanana. Par rapport au rendement, les variétés Fofifa 182, Fofifa 185 et WAB 56-50 montrent un gain d'au moins 5% (5-23%) par rapport à poids grain de Nerica 4 sur trois des six sites. Les deux autres variétés montrent une performance entre 60 – 104% de rendement du témoin Nerica 4. Il faut noter que la pyriculariose était observée sur la variété WAB 706.

Test de 6 variétés sur 20 fermes de référence

P. Autrfray, Hery Zo Rakotofiringa, K.vom Brocke

Objectif :

Évaluer avec des paysans sur 2 campagnes agricoles cinq nouvelles variétés de riz pluvial en comparaison à un témoin commun sur 20 fermes de références dans la région de Moyen Ouest.

Dispositif expérimental

| | |
|---------------------------------------|---|
| Dispositif expérimental : | en bloc randomisé avec 1 ou 2 répétitions par ferme |
| Sites : | 20 fermes de référence |
| Randomisation : | pour chaque agriculteur (voir annexe) |
| Parcelle élémentaire totale : | 40m ² |
| Ecartement entre les lignes : | 0,30 m |
| Ecartement des poquets sur la ligne : | 0,20 m |
| Superficie : | 240m ² par répétition. Au total chaque essai pour un agriculteur fera environ 500 m ² en intégrant des bordures autour de chaque bloc |

Conduite:

| | |
|-----------------|--|
| Date de semis : | à partir de 15 Novembre |
| Semences : | un sachet de 150g par variété pour chaque répétition |
| Démariage : | aucun |

Préparation du sol et gestion de l'essai : selon pratiques habituelles du paysan/de la ferme
 Fertilisation : selon pratiques habituelles du paysan/de la ferme

Evaluation des critères variétaux de préférence

Une discussion sur les critères variétaux préférés a été conduite par l'équipe d'agronomie avec des productrices et producteurs des fermes de référence.

Matériel végétal

Cinq lignées à la fin de sélection issus de programme FOFIFA/CIRAD de Moyen Ouest (MO) et un témoin issus de l'AfricaRice (Nerica 4) :

| N° | Variétés |
|----|--------------------------|
| 1 | NERICA 4 (Témoin) |
| 2 | FOFIFA 182 |
| 3 | FOFIFA 185 |
| 4 | SCRID 090 72-3-1-3-5-1- |
| 5 | SCRID 091 38-4-3-4-1-1-5 |

Liste des critères variétaux préférés

Le tableau montre la fréquence (pourcentages) à laquelle un critère a été mentionné par les participants

| | n | Précocité | Rendement | Battage | goût (sucré) | poids grains | striga | (longue - blanche) | résistance Sècheresse | couleur rouge | peu exigeant en fertilité | Cassure décorticage |
|--------|----|-----------|------------|-----------|--------------|--------------|-----------|-----------------------|--------------------------|------------------|------------------------------|------------------------|
| Femmes | 20 | 30 | 100 | 70 | 40 | 0 | 70 | 25 | 20 | 10 | 0 | 5 |
| hommes | 20 | 65 | 100 | 30 | 5 | 30 | 90 | 30 | 50 | 0 | 10 | 0 |

Le niveau de productivité des 20 parcelles était hétérogène entre en moyenne 1500 kg/ha et 500 kg/ha pour le poids grain de 6 variétés testées. La figure montre la distribution de rendement moyen (RDM) des essais des 20 fermes sous forme de box plots. Les données ont été analysées en tenant compte de cette variabilité. Chaque ferme était ainsi associé à un niveau de productivité.

L'analyse de variance montre des effets significatifs pour les facteurs Variété et Niveau de production, mais pas d'interaction de ces deux facteurs.

ANOVA Type 3 Tests of Fixed Effects (model mixed)

| Effect | Num DF | Valeur F | Pr > F |
|---------|--------|----------|--------|
| NIV | 2 | 29.96 | <.0001 |
| VAR | 5 | 13.95 | <.0001 |
| NIV*VAR | 10 | 0.36 | 0.9585 |

Les variétés les plus performantes dans tous les trois niveaux de productivité étaient la variété S90 (SCRID 090 72-3-1-3-5-1-) et F181 (FOFIFA 182). Le rendement de ces variétés a dépassé le rendement de témoin Nerica 4 (pas significatif).

Moyennes de six variétés dans trois niveaux de productivité

Maintenance et gestion des collections

Trois panel sont maintenus dans le programme

- La collection principale avec tout le matériel de programme (collection de travail)
- Un panel des accessions indica « Orytage Indica » établi dans le cadre de projet ORYTAGE
- Un panel des accessions japonica « Orytage japonica » établi dans le cadre de projet ORYTAGE

ANNEXE

| Caractère |
|--|
| <i>EPAIG – épaisseur grain</i> |
| <i>LOGR – longueur du grain (mm)</i> |
| <i>LAGR – largeur grain (mm)</i> |
| <i>FER – Fertilité (pourcentage des grains pleins)</i> |
| <i>VI – vigueur à la levée (1 : bon vigueur à 9 très mauvais)</i> |
| <i>HT – hauteur du plant (cm)</i> |
| <i>EP – épiaison (nb jours pour 50% épiaison)</i> |
| <i>FL – floraison (nb jours pour 50% floraison)</i> |
| <i>MAT – maturation (nb jours pour 50% maturation)</i> |
| <i>PMG – poids mille gains (poids de mille grains en g)</i> |
| <i>RDM – poids grain paddy sec (kg/ha)</i> |
| <i>NPA – nombre des panicules (sur 5 poquets)</i> |
| <i>EGR – égrainage (1 : résistance à l'égrainage à 9 : très sensible)</i> |
| <i>TAL – tallage (nombre talles fertiles sur 5 poquets)</i> |
| <i>LOPA – longueur panicule (cm)</i> |
| <i>VR – verse (1 : résistance à la verse à 9 : très sensible)</i> |
| <i>MANQ – poquets manquants (nombre)</i> |
| <i>STG – stay green (1 : très bon stay green à 9 : très mauvais)</i> |
| <i>Ex – exertion (1 : très bon exertion à 9 : très mauvais)</i> |
| <i>PC – Pyri-cou (1 : résistante à 9 très sensible)</i> |
| <i>Poc_ « nom témoin » – rendement en pourcentage de témoin</i> |
| <i>BR – brunissure gaine (1 : résistante à 9 très sensible)</i> |
| <i>TACH – taches sur les grains (1 : pas de taches à 9 beaucoup de taches)</i> |

Un catalogue avec 17 fiches variétales en français et malagash (publié dans le cadre de projet FSP PARRUR)

Les techniques de base de la culture du riz pluvial

(source : FOFIFA/CIRAD, 2015. La riziculture Pluviale - Opérations culturales recommandées. Coopération franco-malgache, FSP PARRUR)

Toro-làlana ara-teknika momban'ny voly vary an-tanety

1 - Labour. Une bonne porosité du sol est indispensable pour une bonne installation du riz. Le labour doit être assez profond (20 cm environ) et effectué de préférence en fin de cycle.

Ny Fiazana ny tany. Ny tany mirakara tsara no mahatsara ny vary an-tanety. Ataovy lalina ny asa (20 sm eo eo) mba hidiran'ny nivotra sy ny hamandoana tsara ary asaina aloha be (aoriana ny fiakaram-bokatra raha azo atao!)

2 - Semis. Le semis doit être fait le plus tôt possible après le début des pluies. Le semis en poquets espacés de 20 cm de chaque côté est recommandé, à raison de 4 à 8 graines par poquet.

La profondeur appropriée est de 2 à 3 cm pour assurer une bonne germination. Les graines semées trop profond germent tardivement. Un fumier de qualité doit être apporté au poquet à la dose de 5 à 10 t/ha au minimum. L'apport au poquet d'un engrais complet comme le NPK est conseillé à la dose de 100 kg/ha.

Ny famafazana. Atao aloha arak'izay tratra ny famafazana raha vao tonga ny orana voalohany! Ambolena isan-davaka mitora-tady mielanelana 20 sm mba hanamora ny fiavàna ka voam-bary 4 hatramin'ny 8 isan-davaka no atafy. Roa ka hatramin'ny 4 sm ny halalin'ny mba hahafahan'ny voam-bary mitsimoka tsara. Tsy tafapoitra ny voam-bary raha lasa lalina loatra. Tokony hitondra zezi-pahitra 5-10 t/ha farafaharatsiny. Zezika manarapenitra sy misy kalitao no tokony ho entina amin'izany ary atao isan-davaka. Tsara ihany koa raha mampiasa zezi-bazaha feno, toy ny NPK ka farafaharatsiny 100 kg/ha.

Semis en poquet sous couverture végétale
Latsa-boa isan-davaka amin'ny voly rakotra

3 - Sarclage. Le premier sarclage doit être précoce, dès que les plantules ont bien levé. Au moins deux sarclages sont nécessaires.

Ny Fiazana. Ny ahi-dratsy no tena tsy mampahomby ny voly vary an-tanety, atao faran'izay aloha ny fiavàna voalohany raha vao mipotitra ny ahi-dratsy ka efa maniry tsara ny vary mba tsy ho lasan'ny ahitra ny zezika, ary tokony havaina indroa fara-fahakeliny ny vary.

4 - Apport d'urée. Un apport d'urée est recommandé, mais ne devra pas être trop important pour ne pas favoriser la pyriculariose et la verse (50 à 100 kg/ha sont généralement satisfaisants). A apporter en 1 ou 2 apports en début de tallage et à la montaison, de préférence après le sarclage. Ne pas épandre à la volée si les feuilles sont humides.

Ny zezika simika siramamy « urée ». Tsara ihany koa raha mampiasa zezika simika urée, kanefa tsy tokony hatao betsaka loatra izany satria mampirongatra ny aretina matifotsy ary mitanika ny "mandavo" (verse) na mampilofika ny vary izany. 50-100 kg/ha no fatra tokony hampiasaina. Azo entina indray mandeha na indroa mitondra rehefa misakelika sy rehefa misondro-dreny (na bevoka) ny vary. Tokony aorian'ny fiavàna mandrakariva no mitondra zezika siramamy. Tandremo, tsy azo afendrika ny zezika siramamy raha mando sy lena ny ravim-bary satria sady mandoro ny ravim-bary izany no very lasa entona ny zezika.

5 - Récolte. Pour le battage après la récolte et le séchage, utiliser une bâche en plastique pour améliorer la qualité.

Ny Femoriam-bary. Mampiasa labasy plastika (goelaka) rehefa mively vary sy manahy vary mba hiarovana amin'ny vatokely. Aoka tsy hohamainina eny amin'ny sisin'arabe fa mampihena ny kalitao'ny vary izany sady tsy mahasalama.

Disponibilité des semences de riz pluvial

Des variétés améliorées de riz pluvial adaptées à la haute et moyenne altitude à Madagascar

Karazam-bary an-tanety vaovao mety amin'ny toerana avo sy afovoany andrefana eto madagasikara

Catalogue des variétés de riz pluvial (17), issues du programme de sélection mené en partenariat par le FOFIFA et le CIRAD, adaptées à la culture pluviale sur les versants des collines (tanety).

Ireo karazam-bary an-tanety (17) azo avy amin'ny fikarohana iarahan'ny FOFIFA sy ny CIRAD.

Journée portes-ouvertes sous le thème de la « biodiversité » rassemblant paysans et partenaires techniques

Introduction

Fampidirana

Madagascar est un pays de tradition rizicole avec une consommation moyenne annuelle de riz par individu estimée à 130 kg. Cependant, la production de riz n'augmente pas à la même vitesse que la population. Dans la **zone de Hautes Terres** (haute altitude > 1300 m) de Vakinankaratra, les possibilités d'expansion de la riziculture irriguée sont de plus en plus limitées du fait de la saturation foncière et de la croissance démographique. La **région de Moyen Ouest** (moyenne altitude 800 - 1300 m) présente un fort potentiel de développement pour la riziculture pluviale (réserves importantes de terres arables) et pourrait contribuer à améliorer la sécurité alimentaire du pays. Le développement de la riziculture pluviale apparaît donc comme une réponse à la demande croissante de riz.

Madagasikara dia firenena mpamboly vary, ary ny malagasy dia mihinam-bary eo ho eo amin'ny 130 kg isan'olona anatin'ny taona iray. Tsy maharaka ny fitombon'ny mponina anefa arak'izany ny voka bary. Etsy andaniny, tsy afaka manitatra ny tanimbary intsony ny ety amin'ny **faritra avon'ny** Vakinankaratra (> 1300 m), satria efa saika lasa tanimbary daholo ny lohasaha rehetra, ary etsy ankilany koa ny fihazakazahan'ny fitomboan'ny mponina. Ny **faritra afovoany andrefan'ny** Vakinankaratra (800 - 1300 m) anefa dia manana velaran-tany midadasika ary mety tsara amin'ny vary an-tanety, hany ka afaka manampy tsara amin'ny ady amin'ny tsy fanjariantsakafo. Azo lazaina izany fa manampy tokoa amin'ny tsy fahampian'ny famokaram-bary ny fambolena vary an-tanety.

Zones d'adaptation des variétés améliorées de riz pluvial Haute Terres et Moyen Ouest

Ireo faritra aty afovoan-tany sy afovoany andrefana azo ambolena an'ireo karazam-bary an-tanety vaovao

Le **Moyen Ouest** qui couvre les altitudes entre 800 m et 1300 m sont caractérisées par une saison de culture pluviale entre Novembre et Avril avec une pluviométrie de 1300 mm annuel et des températures entre 18°C et 30°C.

Ny fotoam-pambolena eny amin'ny faritra afovoany andrefana (800 m - 1300 m) dia eo anelanelan'ny Novambra sy Aprily. Eo amin'ny 1300 mm eo ho eo ny mandrefin'orana isan-taona, ary ny hafanana kosa dia eo anelanelan'ny 18°C ka hatramin'ny 30°C.

Les **Hautes Terres** centrales qui couvrent les altitudes entre 1300 m et 1850 m sont caractérisées par une saison de culture pluviale entre Octobre et Avril avec une pluviométrie de 1400 mm annuel et des températures entre 12°C et 25°C.

Ny fotoam-pambolena aty amin'ny faritra avo (1300 m - 1850 m) dia eo anelanelan'ny Oktobra sy Aprily. Eo amin'ny 1400 mm eo ho eo ny mandrefin'orana isan-taona, ary ny hafanana kosa dia eo anelanelan'ny 12°C ka hatramin'ny 25°C.

Programme de sélection pour développer des variétés de riz pluvial adaptées à l'écologie des Hautes Terres

Ny Fikarohana karazam-bary an-tanety mifanaraka amin'ny toerana avo

L'absence de variétés de riz pluvial suffisamment tolérantes au froid a conduit au lancement d'un programme de création variétale en 1985 dans le cadre d'un partenariat entre le centre national de recherches appliquées pour le développement rurales malgaches (Cenrapru/FOFIFA) et le Centre de coopération internationale en recherche agronomique pour le développement (CIRAD).

Ny tsy fisian'ny karazam-bary an-tanety mahatany ny hatsiaka no nahatonga ny fametrahana ity fandaharam-pikarohana ity tamin'ny taona 1985 noho ny fahamiantan'ny seha-pikarohan'ny FOFIFA sy ny CIRAD.

Les objectifs et critères de sélection pour cette écologie sont :

- ✓ La **tolérance au froid** qui se manifeste par un pourcentage élevé des épillets fertiles
- ✓ Un **cycle semis-maturité** entre 120 et 150 jours
- ✓ La **résistance à la maladie**, notamment la pyriculariose qui affecte les feuilles et les grains

Ireo tanjona sy fepetra takian'ny fifantenana ireo karazam-bary an-tanety vaovao dia:

- ✓ Ny **fahatantecane hatsiaka**, izay miseho amin'ny alalan'ny voam-bary feno tsara fa tsy be akofa
- ✓ Fahamatoizana tsy dia tara loatra, 120 hatramin'ny 150 andro
- ✓ **Mahatany aretina** indrindra indrindra ny matifotsy izay miantraika any amin'ny ny ravim-bary sy ny voam-bary

Pyriculariose
(A) champ, (B) feuilles, (C) tiges et panicules
Matifotsy
(A) tanim-boly, (B) ravim-bary, (C) tovom-bary sy salohim-bary

Huit (8) variétés issues de ce programme et inscrites dans le catalogue national sont aujourd'hui disponibles pour la diffusion :

Miisa valo (8) ireo karazam-bary an-tanety vaovao nohatsaraina ka efa napanitaka amin'izao fotoana izao:

Programme de sélection pour développer des variétés de riz pluvial adaptées à l'écologie de Moyen Ouest

Ny Fikarohana karazam-bary an-tanety mifanaraka amin'ny faritra afovoany andrefana

La pratique de la riziculture pluviale dans les zones de moyenne altitude (Moyen Ouest) existait déjà dans les années 60. Mais les variétés cultivées dans cette écologie sont essentiellement des variétés assez anciennes introduites du Brésil. Le FOFIFA et le CIRAD ont donc mis en route en 2006 un programme d'amélioration génétique pour renouveler les variétés de riz pluvial destinées à cette écologie.

Tany amin'ny taona 60 tany ho any no efa nisy ny fambolena-bary an-tanety tany amin'ny faritra afovoany andrefana. Ambika avy any ivelany no nambolena tamin'izany fotoana izany. Ny taona 2006 no nanomboka niara-namaritra fandaharan'asam-pikarohana momban'ny fanatsaràna ny karazam-bary ny FOFIFA sy ny CIRAD mba hanavaozana ireo karazam-bary izay mahatany ny toe-tany any afovoany andrefana.

Les objectifs et critères de sélection pour cette écologie sont :

- ✓ **Résistance aux maladies** comme la pyriculariose
- ✓ **Résistance au strige asiatica**
- ✓ **Efficience d'utilisation des nutriments** (peu ou pas d'intrants utilisés)
- ✓ Diversification des **types de grains**

Ireo fepetra tadiavina ka nifantenana ireo vary an-tanety dia:

- ✓ Ny **fahatantecane aretina** indrindra fa ny matifotsy
- ✓ Ny **fahatantecany ny ehi-dratsy (arema)** na ny strige asiatica
- ✓ Tsy dia mila zezika loatra
- ✓ Fampitomboana ny **karazana voam-bary**

Striga asiatica
Striga asiatica

Huit (8) variétés des phénotypes divers issues de programme FOFIFA/CIRAD et AfricaRice sont inscrites dans le catalogue national et disponible pour la diffusion :
